

Test Summary Report

Project: Login and Registration Module Testing

Tester: Kaleemuddin Mohammed

Date: 03/04/2026

1. Objective

The objective of this testing activity was to verify the functionality, validation, and reliability of the Login and Registration modules of the web application. The testing focused on ensuring that users can successfully register and log in, while the system properly handles invalid inputs and validation rules.

2. Scope of Testing

The following modules were tested:

- User Registration Module
- User Login Module

The testing included the following scenario types:

- Positive scenarios
- Negative scenarios
- Validation checks
- Boundary value test cases

3. Test Execution Summary

Module	Total Test Cases	Executed	Passed	Failed
Registration	15	15	14	1
Login	15	15	15	0
Total	30	30	29	1

4. Observations

Most functionalities of the Login and Registration modules worked as expected. Validation checks for required fields, email format, password confirmation, and authentication behavior were verified successfully.

During testing, one issue was identified in the Registration module related to input validation for name fields.

5. Defects Identified

One defect was observed during testing.

The system allows numeric values in the **First Name** and **Last Name** fields during registration. Typically, these fields are expected to accept alphabetic characters only.

6. Additional Observation

It was observed that even when the “**Remember me**” checkbox was not selected during login, the user session remained active after refreshing the browser and reopening it. Ideally, the user should be required to log in again when the “Remember me” option is not selected. This behavior may indicate a potential issue with session management.

7. Conclusion

Based on the executed test cases, the Login and Registration modules are functioning mostly as expected. One validation issue was identified in the Registration module, and an observation related to session handling was noted for further review.
